FE-680 - Assignment 4

Problem 1

Verify that if the CDS spread for the example in Tables (1 to 4) is 100 basis points, then the probability of default each year (conditional on no earlier default) must be 1.61%. How does the probability of default change when the recovery rate is 20% instead of 40%? Verify that your answer is consistent with the implied probability of default being approximately proportional to 1/(1-R) where R is the recovery rate.

Table 1. Unconditional default probabilities and survival probabilities

Time (years)	Default probability	Survival probability
1	0.0200	0.9800
2	0.0196	0.9604
3	0.0192	0.9412
4	0.0188	0.9224
5	0.0184	0.9039

Table 2. Calculation of the present value of expected payments. Payment = s per annum

Time (years)	Probability of survival	Expected payment	Discount factor	PV of expected payment
1	0.9800	0.9800s	0.9512	0.9322s
2	0.9604	0.9604s	0.9048	0.8690s
3	0.9412	0.9412s	0.8607	0.8101s
4	0.9224	0.9224s	0.8187	0.7552s
5	0.9039	0.9039s	0.7788	0.7040s
Total				4.0704s

Table 3. Calculation of the present value of expected payoff. Notional principal = \$1.

Time (years)	Probability of default	Recovery rate	Expected payoff (\$)	Discount factor	PV of expected payoff (\$)
0.5	0.0200	0.4	0.0120	0.9753	0.0117
1.5	0.0196	0.4	0.0118	0.9277	0.0109
2.5	0.0192	0.4	0.0115	0.8825	0.0102
3.5	0.0188	0.4	0.0113	0.8395	0.0095
4.5	0.0184	0.4	0.0111	0.7985	0.0088
Total					0.0511

Table 4. Calculation of the present value of accrual payment.

Time (years)	Probability of default	Expected accrual payment	Discount factor	PV of expected accrual payment
0.5	0.0200	0.0100s	0.9753	0.0097s
1.5	0.0196	0.0098s	0.9277	0.0091s
2.5	0.0192	0.0096s	0.8825	0.0085s
3.5	0.0188	0.0094s	0.8395	0.0079s
4.5	0.0184	0.0092s	0.7985	0.0074s
Total				0.0426s

Problem 2

Suppose that the risk-free zero curve is flat at 4% per annum with continuous compounding and that defaults can occur at times 0.25 years, 0.75 years, 1.25 years, and 1.75 years in a two-year plain vanilla credit default swap with semiannual payments. Suppose that the recovery rate is 20% and the unconditional probabilities of default (as seen at time zero) are 1% at times 0.25 years and 0.75 years, and 1.5% at times 1.25 years and 1.75 years. What is the credit default swap spread? What would the credit default spread be if the instrument were a binary credit default swap?

Problem 3

Consider the following CDSs for Goldman Sachs:

		Spread
Tenor	CD1016 Mid Spr GS Sr CDS	(bps)
6M	GS CDS USD SR 6M D14 Curncy	30.2
1Y	GS CDS USD SR 1Y D14 Curncy	38.9
2Y	GS CDS USD SR 2Y D14 Curncy	47.1
3Y	GS CDS USD SR 3Y D14 Curncy	58.8
4Y	GS CDS USD SR 4Y D14 Curncy	72.8
5Y	GS CDS USD SR 5Y D14 Curncy	83.9
7Y	GS CDS USD SR 7Y D14 Curncy	109.8
10Y	GS CDS USD SR 10Y D14 Curncy	127.7

Reference Entity Information
Name: Goldman Sachs Group

Sector: Financials

Industry: Financial Industry

Credit Default Swap Contracts Information

Country: US

Coupon Frequency: Quarterly

Debt Type: Senior Day Count: ACT/360

Currency: USD Recovery: 0.40

Consider the following Interest Rate Yields:

Tenor Yield 1M 0.995 2M 1.0372 3M 1.1696 6M 1.4304 1Y 1.7765 2Y 1.5635 3Y 1.7165 4Y 1.839 5Y 1.9365 6Y 2.024 7Y 2.097 8Y 2.161 9Y 2.2205 10Y 2.267 12Y 2.352 15Y 2.431 20Y 2.504 25Y 2.529 20Y 2.532

Please estimate the hazard rate curve from the CDS spreads of GS. For the valuation model assume the JPMorgan model (defaults can occur midway during each payment period, but the accrual is made at the end of the periods).
